June 10, 2024

Planned Activity

Planned Actions: DevSecOps Tools Monthly Maintenance

Impacted Application Development Organizations (ADOs): All ADOs

Planned Downtime: Friday, June 14, 2024, at 6:00 p.m. ET to Saturday, June 15, 2024, 10:00 a.m. ET.

What To Expect: Users may experience degraded service during this window.

The following DevSecOps tools will undergo OS patching and upgrade maintenance starting at 6 p.m. ET on Friday, June 14th:

- CloudBees Jenkins
- Nexus Repository Manager
- ClamAV
- Splunk
- RSyslog
- IBM Connect

We expect maintenance to be complete for most tools on this same day by 9:00 p.m. ET.

The Ansible Automation platform will also transition from a multi-tenant to a single-tenant environment. No changes are expected on the users' end.

Splunk will undergo additional maintenance for performance optimization, including migration the indexer cluster to a single-tenant. While the maintenance may be completed sooner, we anticipate it will be fully completed by 10 a.m. ET on Saturday, June 15th, with Splunk functioning normally.

For any questions or concerns, please feel free to reach out to the DevSecOps team on Slack **#help-devsecops** channel.
